

Raja Sahil Changaiz's Complete Course Notes

1. Basic

Summary

The meeting focused on teaching supply and demand trading concepts, led by an experienced instructor.

Raja began by explaining the basic structure of the course, which consists of five sessions. The first four sessions will cover high timeframe analysis (monthly, weekly, and daily), focusing on understanding market direction. The fifth session will address lower timeframes.

Raja explained supply and demand using a milk packet analogy: when demand is high and supply is low (30 packets needed but only 5 available), prices increase. Conversely, when supply is high and demand is low (30 packets available but only 5 needed), prices decrease.

Raja detailed the concept of base candles and departure candles. Base candles are small candles that work as continuation or stopper patterns. A proper departure candle is needed after a base candle to draw supply/demand zones.

The discussion covered two types of supply and demand: basic (rally and peak patterns) and advanced (CP - Continuation Pattern and PCP - Potential Continuation Pattern). Raja emphasized that these patterns can be found in any timeframe, from monthly to 1-minute charts.

The session concluded with an explanation of gaps in the market, particularly those occurring during weekend breaks or major news events. Raja emphasized the importance of understanding market direction before trading in lower timeframes.

Chapters

Course Structure and Basic Concepts

Raja outlined a five-session course structure, with the first four sessions focusing on high timeframe analysis and the fifth on lower timeframes. Basic supply and demand concepts were explained using a milk packet analogy.

Base and Departure Candles

Raja explained the importance of base candles (small candles) and departure candles in drawing supply and demand zones. Proper departure candles must be at least two times the size of base candles.

Types of Supply and Demand Patterns

Two main types were discussed: basic (rally and peak patterns) and advanced (CP and PCP levels). Raja demonstrated how these patterns appear across different timeframes.

CP and PCP Levels

Raja explained Continuation Patterns (CP) and Potential Continuation Patterns (PCP), emphasizing that a maximum of three CP levels should be used for trading.

Market Gaps and Trading Strategy

Raja discussed how gaps form during weekends or major news events, and explained strategies for trading these gaps effectively.

Action Items

Raja emphasized to wait for proper departure candles before drawing supply/demand zones

Raja recommended using maximum three CP levels for trading

Raja advised to understand high timeframe direction before trading lower timeframes

Raja suggested to focus on monthly and weekly timeframes for position trading

Raja recommended to trade with market makers rather than following retail trader patterns

2. strong zone and weak zones, confirmation rules, inheritance

Summary

The meeting focused on supply and demand trading strategies, particularly emphasizing the importance of identifying and using strong zones for trading.

Raja explained that not all supply and demand levels should be used for trading - only strong zones are suitable. Strong zones are categorized into two types: simple CP level strong zones and arrival zones. A CP level becomes a strong zone when the market removes the opposite zone.

Raja detailed that arrival zones are identified when the market crosses a trend line and removes the opposite zone. For retested zones, Raja emphasized that set and forget rules can be used on the first trade, but confirmation rules must be applied for subsequent trades.

The discussion then moved to inheritance zones, which are weak zones that don't remove opposite zones but are located at peak levels. Raja explained that confirmation rules can be applied to inheritance zones, with a 90% chance of the market breaking through these zones.

Raja concluded by discussing flip areas and overlap areas, emphasizing that confirmation rules should be used for these zones rather than set and forget strategies. The presentation included multiple examples using various currency pairs to illustrate these concepts.

Chapters

Understanding Strong Zones in Supply and Demand Trading

Raja emphasized that traders should only use strong zones for trading, not all supply and demand levels. Strong zones are categorized into CP level strong zones and arrival zones.

Trading with Retested Zones

Raja explained that for retested zones, set and forget can be used first time on monthly timeframes, but confirmation rules must be applied for subsequent trades.

Inheritance Zones and Their Characteristics

Raja described inheritance zones as weak zones that don't remove opposite zones but are located at peak levels, with specific trading implications and a 90% chance of breaking.

Flip Areas and Overlap Areas

Raja detailed how flip zones work when market crosses resistance levels and become support levels, emphasizing the need for confirmation rules in these areas.

Action Items

Raja recommends using set and forget strategy only for strong zones

Raja advises to wait for market to cross trend line before confirming trades in arrival zones

Raja suggests using confirmation rules for retested zones after first trade

Raja recommends applying confirmation rules on inheritance zones due to their weak nature

Raja advises to use confirmation rules instead of set and forget for overlap areas

3. Change Direction, High Curve and low curve

Summary

The meeting focused on trading strategies and market analysis, particularly regarding zones and trend lines.

Raja explained the fundamental rules of trading based on trend lines and zones. When the market crosses a trend line and removes two opposite zones, it indicates a potential direction change. This was demonstrated using examples from EUR/USD and Gold charts.

The discussion then moved to the concept of high and low curve areas. Raja emphasized that the 0-25% area near high curves is for sellers, while the 0-25% area near low curves is for buyers. They advised against using demand levels near high timeframe supply levels to avoid losses.

Regarding position management, Raja shared their strategy of adjusting stop losses with new fresh zones rather than strictly adhering to TP levels. They also discussed the importance of proper zone identification and trend line breaks, using examples from Gold and EUR/USD charts.

The session concluded with a detailed analysis of EUR/USD, where Raja identified arrival zones and potential trading opportunities, suggesting a 90% chance for selling based on current market conditions.

Chapters

Trading Rules for Trend Lines and Zones

Raja explained how market behavior changes when crossing trend lines and removing opposite zones. They emphasized that removing two opposite zones typically indicates a direction change, using EUR/USD as an example.

High and Low Curve Trading Strategy

Raja detailed the strategy for trading in different curve areas, explaining that 0-25% areas near high curves are for sellers and near low curves are for buyers. They warned against using demand levels near high timeframe supply levels.

Position Management and Stop Loss Strategy

Raja shared their approach to managing positions by adjusting stop losses with new fresh zones instead of fixed TP levels, particularly in high timeframe trades.

EUR/USD Analysis and Trading Opportunities

Raja provided a detailed analysis of EUR/USD, identifying arrival zones and potential trading opportunities, suggesting a strong selling bias with approximately 90% probability.

Action Items

Raja advised to wait for market retest after crossing the second zone

Raja recommended closing positions when market removes two opposite zones

Raja suggested waiting for candle closure above trend line before taking action

Raja recommended monitoring EUR/USD for potential selling opportunity with 500 pips target

4. Location, Momentum, Impulses verses Corrections

Summary

The meeting focused on trading strategies and market analysis, particularly discussing trend lines, momentum, and location areas.

Raja began by explaining impulsive and corrective market movements. When markets follow trend lines, they create long candles during impulsive moves and smaller base candles during corrections. Raja emphasized that good traders focus on catching impulsive moves rather than corrections, especially on lower timeframes.

The discussion then moved to high timeframe trading, where both impulsive and corrective moves can be traded. Raja explained how to identify strong supply and demand zones, particularly focusing on inheritance zones and their relative weakness.

Raja detailed momentum and location area concepts, explaining how combining these elements leads to stronger trading opportunities. They emphasized the importance of finding areas where momentum and location coincide for optimal trade entries.

Regarding risk management, Raja advised using appropriate lot sizes based on account size. For accounts between \$100-500, they recommended starting with 0.01 lot size and gradually increasing as profit grows. They stressed the importance of maintaining emotional control through proper position sizing.

The session concluded with a discussion about Gold and currency pairs in relation to upcoming elections, with specific analysis of potential market movements based on election outcomes.

Chapters

Understanding Trend Lines and Market Movement Types

Raja explained the difference between impulsive and corrective market movements. Impulsive moves follow trend lines with long candles, while corrections show smaller base candles. They emphasized that traders should focus on catching impulsive moves for better results.

High Timeframe vs Low Timeframe Trading Strategies

Raja discussed how trading approaches differ between high and low timeframes. On high timeframes, both impulsive and corrective moves can be traded, while on lower timeframes, focus should be primarily on impulsive moves.

Momentum and Location Area Analysis

Raja introduced the concept of momentum trading combined with location areas. They explained how strong market moves occur when momentum and location areas align, providing examples from their own trading experience.

Risk Management and Position Sizing

Raja provided detailed guidance on risk management, recommending specific lot sizes based on account size. For accounts between \$100-500, they advised starting with 0.01 lot size and gradually increasing as profits grow.

Action Items

Raja advised traders to use 0.01 lot size for accounts between \$100-500 USD

Raja recommended to maintain a \$500 backup and use \$100 as margin equity

Raja suggested to gradually increase lot size as profits grow: 0.02 lots at \$200 profit, 0.03 lots at \$400 profit

Raja advised to monitor Gold and USD pairs for potential movements based on election results

5.realignment small video

Summary

The meeting focused on explaining alignment and sequence number concepts in trading.

Raja explained that sequence numbers are determined by market movements across different timeframes. When both monthly and weekly timeframes are dropping, traders can sell on the daily timeframe. Conversely, when monthly and weekly are rising, buying opportunities exist on the daily timeframe.

Raja detailed the realignment concept, explaining that when the market crosses a trendline and removes opposite zones after both monthly and weekly timeframes have dropped, traders should wait for the market to retest the weekly timeframe. Raja emphasized finding daily timeframe entries near weekly timeframe zones for optimal trading opportunities.

Using Euro USD as an example, Raja demonstrated how to identify trend lines and zones, explaining that when the market crosses the trend line and removes opposite zones, it indicates a potential retest of higher timeframe areas. Raja stressed the importance of using daily timeframe entries near weekly timeframe zones for realignment trades.

Chapters

Understanding Sequence Numbers in Trading

Raja introduced the concept of sequence numbers in trading, explaining how they relate to different timeframe movements. When monthly and weekly timeframes are dropping, traders can look for selling opportunities on the daily timeframe, and vice versa for buying opportunities.

Realignment Concept and Market Movement

Raja detailed how realignment occurs when the market crosses a trendline after monthly and weekly drops. Traders should wait for market retests of weekly timeframe zones while finding suitable daily timeframe entries.

Euro USD Example Analysis

Using Euro USD as a practical example, Raja demonstrated trend line identification and zone analysis, showing how market movements across the trend line indicate potential retests of higher timeframe areas.

Trading Strategy Implementation

Raja explained how to combine weekly and daily timeframe analysis for trading decisions, emphasizing the importance of using daily timeframe entries near weekly timeframe zones for optimal trade execution.

Action Items

Raja instructed to wait for market retest of weekly timeframe after trend line cross

Raja emphasized to find daily timeframe entries near weekly timeframe zones

Raja advised not to use zones after market crosses trend line and removes two opposite zones

Raja recommended to use fresh zones for trades when market is aligned in sequence

6. wow trade

Summary

The meeting focused on explaining momentum trading strategies and wow trade areas. Raja detailed how to identify and trade using trend lines and supply/demand zones.

Raja explained that when the market crosses a trend line, it creates a wow trade area between supply and demand levels. They emphasized that traders should wait for proper market removal of zones before entering trades.

The discussion covered multiple examples across different currency pairs, demonstrating how to identify wow trade areas when market crosses trend lines. Raja stressed the importance of waiting for confirmation through proper zone removal and OHCL candle closures.

Raja also addressed risk management, noting that traders should focus on pairs offering good pip potential and avoid trading in areas with limited profit potential. They emphasized the importance of considering multiple timeframes, from monthly down to lower timeframes, for proper trade analysis.

Chapters

Understanding Momentum and Supply/Demand Levels

Raja introduced the concept of momentum trading using supply and demand levels. They explained how market movement between these levels creates trading opportunities when one zone removes another.

Wow Trade Area Identification

Raja detailed how to identify wow trade areas between supply levels and explained the concept of extension of PIPs. They emphasized the importance of trend line analysis in low timeframes.

Multiple Timeframe Analysis

Raja demonstrated how to analyze markets across different timeframes, from monthly to lower timeframes, showing how trend lines and zones interact across these timeframes.

Trade Entry Confirmation Rules

Raja explained the importance of proper market removal of zones and candle closure confirmation before entering trades, particularly noting Friday trading considerations due to low volume.

Action Items

Raja advised to wait for market removal of demand zones before selling

Raja recommended focusing on pairs with good pip potential for better risk management

Raja instructed to check for proper trend line crosses before entering trades

Raja emphasized the need to verify zone removal with proper candle closures

7. Multiple Time Analysis

Summary

The meeting focused on trading strategy analysis and market direction identification across different timeframes.

Raja explained the process of analyzing markets from monthly timeframes down to H4 and H1. They emphasized that after identifying targets on monthly timeframes (showing potential for 700+ pips), traders should move to lower timeframes for entry points.

The discussion included detailed analysis of specific trading examples. Raja demonstrated how to identify zones on monthly charts and explained that these zones could offer opportunities for 800-1000 pips movement. They stressed the importance of waiting for proper retracement and confirmation before entering trades.

When addressing different directions between monthly and weekly timeframes, Raja advised waiting for proper retracement and confirmation. They explained that if monthly shows long and weekly shows mixed signals, traders should wait for clear confirmation before entering trades.

Raja also covered the concept of opposite zones, explaining that when market crosses two opposite zones on a particular timeframe, it will likely move to the strong zone on the higher timeframe. They emphasized the importance of gap analysis and trend line confirmation in trading decisions.

Chapters

Monthly and Weekly Timeframe Analysis Strategy

Raja explained how to analyze monthly timeframes first to identify targets, showing potential for 700+ pips movement. They emphasized not to trade directly from monthly timeframes but use them for direction.

Lower Timeframe Entry Strategy

Discussion of how to move from higher timeframes to lower ones (H4 and H1) for entry points. Raja demonstrated how to identify proper entry zones and explained the importance of trend line analysis.

Multiple Timeframe Direction Analysis

Raja addressed how to handle conflicting signals between monthly and weekly timeframes, emphasizing the importance of waiting for proper retracement and confirmation.

Zone Analysis and Gap Strategy

Detailed explanation of how to identify and use trading zones, including gap analysis and the importance of confirmation through multiple factors like trend lines and price action.

Action Items

Raja advised to wait for market retracement completion before entering trades when different timeframes show conflicting directions

Raja recommended to identify monthly direction first before moving to lower timeframes for entry

Raja suggested to use strong zones for trades when monthly trend line shows long but subsequent candles are mixed

Raja instructed to wait for market to leave daily opposite demand zone before taking new trades
